

CRM Sales Pipeline Analysis

Data Cleaning, Star Schema Modeling & Revenue Insights

Excel, Power Query & Power BI

Project Done By: Dhanalakshmi A

Date: 08/07/2026

1. Project Overview and Objective

This project analyses a B2B CRM sales pipeline dataset covering four connected tables: sales transactions, client accounts, product catalog, and sales team structure. The work spans two stages: data cleaning and modeling in Excel and Power Query, followed by an interactive analytical dashboard built in Power BI.

The objective was to take raw, inconsistent CRM data and turn it into a reliable, well-modeled dataset, then use it to answer real business questions — which regions and products drive revenue, how effective the sales team is at converting deals, and whether deal size relates to how long a deal takes to close.

2. Problem Statement

- Analyse sales performance across regions and products to identify top-performing areas and revenue drivers.
- Evaluate the sales funnel and conversion effectiveness (win rate) of the sales team.
- Identify and resolve data quality issues in the raw CRM export in a structured, repeatable way.
- Test whether deal size is related to how long a deal takes to close.
- Restructure the flat CRM export into a proper fact-and-dimension model for scalable reporting.

3. Tools & Technologies

- Excel & Power Query — data cleaning, transformation, calculated fields, pivot tables, descriptive statistics.
- Power BI — data modeling, relationships, DAX measures, interactive dashboard with slicers, drill-down and bookmarks.

4. Data Pre-Processing (Excel & Power Query)

All four source tables (Sales Pipeline, accounts, Product, Sales Teams) were loaded into Power Query and cleaned individually. The screenshot below shows the recorded, repeatable cleaning steps applied to the Sales Pipeline table — each step is preserved and auditable.

Power Query Editor interface showing the 'SalesPipeline_Clean' query. The main table displays data with columns: Opportunity ID, Sales Agent Name, Product Name, Company Name, Deal Stage, Engagement Date, and Deal Close Date. The 'Query Settings' pane on the right shows the 'PROPERTIES' and 'APPLIED STEPS' for the query.

Opportunity ID	Sales Agent Name	Product Name	Company Name	Deal Stage	Engagement Date	Deal Close Date
1C17A6R	Moses Frase	Gtx Plus Basic	Canoty	Won	20-10-2016

Power Query Applied Steps — Sales Pipeline cleaning sequence (Trim, Clean, Replace Values, Type changes, Custom columns)

4.1 Cleaning tasks performed

- Removed duplicates — verified zero duplicate records across all four tables.
- Standardized formats — corrected "GTXPro" to "GTX Pro" and spelling errors ("technolgy" to "Technology", "Philipines" to "Philippines") so table joins work correctly.
- Handled missing values with reasoning, not blanket fixes: blank Close Date and Close Value were left as-is since they correctly represent deals that have not closed yet; blank Company Name was flagged as "Unknown Account" rather than deleted.
- Created calculated fields: Is_Closed (flags Won/Lost vs. still-open deals) and Sales_Cycle_Days (days from engagement to close).

Table: TransformColumnTypes(#"Added Custom2",{"Sales_Cycle_Days", Int64.Type}))

	Deal Stage	Engagement Date	Deal Close Date	Deal Close Value	Is_Closed	Sales_Cycle_Days
1	Won	20-10-2016	01-03-2017	1054	Yes	132
2	Won	25-10-2016	11-03-2017	4514	Yes	137

Cleaned Sales Pipeline table showing the Is_Closed and Sales_Cycle_Days calculated fields

4.2 Conditional formatting

Conditional formatting was applied to make patterns visible at a glance: Deal Stage is colour-coded (Won/Lost), Deal Close Value uses data bars to show relative deal size, and Sales_Cycle_Days uses a colour scale to highlight fast versus slow-closing deals.

Opportunity	Sales Agent Name	Product Name	Company Name	Deal Stage	Engagement Date	Deal Close Date	Deal Close Value	Is Closed	Sales Cycle Days
G5S1KYF	Rosie Papadopoulos	Gtx Plus Pro	Kan-Code	Lost	23-08-2017	31-12-2017	\$0.00	Yes	130

Conditional formatting applied to the cleaned Sales Pipeline table

4.3 Descriptive statistics and correlation analysis

Descriptive statistics (mean, median, min, max, standard deviation) were calculated for Deal Close Value and Sales Cycle Days. A correlation test was also run to check whether longer sales cycles are associated with higher-value deals.

Descriptive statistics for Deal Close Value and Sales Cycle Days, and the resulting scatter chart testing correlation between the two

The correlation coefficient came out to 0.05, which is close to zero — meaning deal size and deal speed are independent in this dataset. This was confirmed visually by the scattered, trendless pattern of points and a nearly flat trendline.

4.4 Pivot table summaries

Sum of Deal Close V Column Lab				
Row Labels	Lost	Won	Grand Total	
Central	0	3346293	3346293	
East	0	3090594	3090594	
West	0	3568647	3568647	
Grand Total	0	10005534	10005534	

Pivot Table: Revenue by Regional Office

Sum of Deal Close V Column Lab				
Row Labels	Lost	Won	Grand Total

GTX Basic	0	499263	499263	
GTX Plus Basic	0	705275	705275	
GTX Plus Pro	0	2629651	2629651	
GTX Pro	0	3510578	3510578	
MG Advanced	0	2216387	2216387	
MG Special	0	43768	43768	
Grand Total	0	10005534	10005534	

Pivot Table: Revenue by Product

5. Data Modeling (Power BI)

The four cleaned tables were imported into Power BI and connected into a star schema — one central fact table (Sales Pipeline) surrounded by three dimension tables (Product, Sales Teams, Client Details), plus a dedicated Date table to support time-based calculations.

Power BI Data Model — Sales Pipeline (fact) connected to Product, Sales Teams, Client Details and DateTable, all with one-to-many relationships

Fact table column	Related dimension table	Related column
Product Name	Dim_Product_Clean	Product Name
Sales Agent Name	Dim_SalesTeams_Clean	Sales Agent Name
Company Name	Client_Details(Clean)	Company Name
Deal Close Date	DateTable	Date

A dedicated Date table was created using `CALENDAR(DATE(2016,1,1), DATE(2017,12,31))` to support month, quarter and year groupings and time-intelligence DAX functions, since the raw deal dates alone have gaps — no row exists for a day with no deal activity.

The screenshot shows the Power BI Data model view. The 'DateTable' is highlighted in the 'Data' pane on the right. The 'DateTable' is a calendar table with columns: Date, MonthYear, and MonthYearSort. The table contains rows for every day from January 1, 2016, to January 26, 2016. The 'Date' column shows the full date (e.g., 01 January 2016), the 'MonthYear' column shows the month and year (e.g., Jan 2016), and the 'MonthYearSort' column shows the year (e.g., 201601).

6. DAX Measures

Five DAX measures were created to power the dashboard's cards and charts:

Measure	Purpose
Total Sales	Sum of all recorded deal revenue
Total Deals	Count of all deals in the pipeline
Win Rate %	Share of decided deals (Won+Lost) that were Won
Cumulative Sales	Running total of revenue over time
Sales Growth %	Month-over-month percentage change in revenue

Cumulative Sales — running total using CALCULATE, FILTER and ALLSELECTED on the Date table

1	Sales Growth % =
2	VAR CurrentSales = [Total Sales]
3	VAR PreviousMonthSales = CALCULATE([Total Sales], DATEADD(DateTable[Date], -1, MONTH))
4	RETURN
5	DIVIDE(CurrentSales - PreviousMonthSales, PreviousMonthSales, 0)

Sales Growth % — month-over-month percentage change using DATEADD

7. Analysis and Visualizations (Power BI Dashboard)

All visuals were consolidated onto a single interactive dashboard page, combining KPI cards, bar charts, a donut chart, a line chart, slicers, drill-down and bookmarks.

Consolidated CRM Sales Pipeline Dashboard

7.1 Visualizations used

- Cards — Total Sales, Total Deals, Win Rate %, Average Sales Cycle, Total Clients
- Bar charts — Revenue by Region, Revenue by Product, Revenue by Manager
- Donut chart — Deal Stage Distribution (Won, Lost, Engaging, Prospecting)
- Line charts — Cumulative Sales trend, Sales Growth % trend

- Table — Sales Agent Performance Summary (Total Deals, Total Sales, Win Rate % per agent)

7.2 Interactivity

- Slicers for Regional Office, Deal Stage, Manager and Product allow the whole dashboard to be filtered instantly.
- Drill-down is enabled on the Cumulative Sales chart using the built-in Date hierarchy (Year, Quarter, Month, Day).
- Bookmarks capture four saved states — Month View, Quarter View, West Region View and East Region View — letting a viewer switch between them with one click.

Drill-down in action — chart drilled down to a specific quarter and month

Bookmarks panel showing the four saved report states

Sales Agent Performance table, sorted by total sales

8. Insights & Conclusions

Key findings

- Total revenue across the pipeline is \$10,005,534 from 8,800 recorded deals.
- The funnel breaks down as 48.16% Won, 28.1% Lost, 18.06% Engaging, 5.68% Prospecting.
- Among decided deals, the win rate is 63.15%.
- West region leads revenue (about \$3.57M), followed by Central (about \$3.35M) and East (about \$3.09M).
- GTX Pro is the top revenue-generating product; MG Special contributes the least, consistent with its low list price.
- There is no meaningful correlation (0.05) between sales cycle length and deal value.
- Month-over-month growth is highly volatile, swinging between roughly +50% and -50%, indicating revenue is driven by clusters of large deals rather than steady growth.

Descriptive — what happened

The pipeline closed just over \$10M in revenue across 8,800 deals, with revenue split fairly evenly across three regions and concentrated in the higher-priced GTX product line.

Q: What is the overall performance of the sales pipeline?

A: The pipeline generated \$10,005,534 in total revenue from 8,800 recorded deals, with a 63.15% win rate among decided deals.

Q: How are deals distributed across the funnel stages?

A: 48.16% Won, 28.1% Lost, 18.06% Engaging, 5.68% Prospecting.

Q: Which regions and products performed best?

A: West region led revenue (~\$3.57M), and GTX Pro was the top-performing product (~\$3.51M).

Diagnostic — why it happened

The near-zero correlation between cycle length and deal value suggests outcomes are driven by product and client fit rather than time spent on a deal. Volatility in monthly growth points to revenue being concentrated in a handful of large deals rather than a steady stream of similarly-sized ones.

Q: Why does month-to-month revenue swing so sharply (+50% to -50%)?

A: Because revenue is concentrated in a relatively small number of large deals closing in specific months, rather than a steady stream of similarly-sized deals — a few big wins or losses can swing the whole month's numbers.

Q: Why is there no relationship between sales cycle length and deal value (correlation = 0.05)?

A: Deal outcomes appear to depend more on product type and client fit than on how long a sales rep spends working the deal — speed and size are independent factors.

Q: Why does MG Special contribute so little revenue (\$43,768)?

A: It's the lowest-priced product in the catalog (\$55 list price), so even with reasonable unit sales, its dollar contribution stays low compared to higher-priced GTX products.

Predictive — what is likely to happen

Given a stable win rate of around 63% and consistent product performance, future revenue is likely to remain concentrated in the same product lines and follow a similarly uneven, deal-driven pattern rather than smooth growth.

Q: Is revenue likely to keep growing at a steady pace?

A: No — based on the volatile Sales Growth % pattern, revenue is likely to continue growing unevenly, in bursts tied to large deal closures, rather than smoothly month over month.

Q: Which products are likely to continue driving future revenue?

A: GTX Pro and GTX Plus Pro, since they've consistently outperformed other products and there's no data suggesting a shift in demand.

Q: Is the current ~63% win rate likely to hold going forward?

A: Likely yes, assuming sales processes and team composition remain similar, since the win rate reflects a large, stable sample of 6,711 decided deals rather than a small or recent spike

Prescriptive — what should be done

- Do not deprioritize slow-moving deals assuming they are low-value — deal size and speed are unrelated.
- Investigate the characteristics of the 28.1% Lost deals to find a specific, fixable bottleneck.
- Study what the top-performing West region and top sales agents are doing differently, and replicate it across other regions.

Q: Should the sales team prioritize deals that are moving quickly?

A: No — since cycle length doesn't predict deal value, deals should be prioritized by their actual value/potential, not by how fast they're progressing.

Q: What should be done about the 28.1% Lost deals?

A: Investigate whether losses cluster around a specific product, region, or agent — that would reveal a fixable bottleneck rather than treating all losses as random.

Q: Should MG Special continue to be actively sold?

A: Worth reassessing — given its minimal revenue contribution, the business should decide whether to continue, reposition, or phase it out in favor of higher-performing products.

Q: How can underperforming regions (Central, East) improve?

A: Study what the top-performing West region and top agents are doing differently, and replicate those practices in the other regions.

Thank You
